

* Be prepared for ranking disruption, but 301/ change content as needed - assuming this won't be a significant issue. If it will be, prioritise content production!
 ** Still debated which is the best option here

Best Case Assumptions
 Much of this chart assumes you can make edits to the robots.txt & meta robots directives as required. This is taking a bit of a liberty as it's so often not the case.

However, if you don't have access to the above, you'll need to get far more creative with the fixes!

These aren't the only methods!
 Blocking off large sections of your site using robots.txt isn't ideal for a number of reasons, it's best to fix the problem in development if you can!

Also some sources of crawl budget issues can't be fixed by blocking via robots.txt (i.e. if href lang pages are causing the problem)
